ABSTRACT

The article attempts to formulate modern concepts of the "mechanism of interaction" of the physical factor and the whole organism on the basis of quantum physics, based on the most recent studies of the universe for their subsequent integration into a single science of physiocorrection and physiostabilization of the surrounding world.

KEYWORDS: universe, space, quantum physics, tunnel effect, "super-perfect energy-informational field".

INTRODUCTION

It should be recognized that the actual problem of modern world science is the recognition of the existence of a single "super-perfect energy-informational field" of the universe in the entire Universe and Space. An imperceptible, intangible and invisible "super-perfect energy-informational field" fills the entire space between elementary particles, atoms, molecules, cells, organs of the whole organism, the surrounding world, and outer space with all its contents.

The "super-advanced energy-informational field" that contributes to the creation of matter is constantly in a stable tension (tone) for the harmonious coexistence of the entire contents of the biosphere and the cosmos, consisting of elementary particles. Today, we can assume that the smallest elementary particles are "strings" (energy information) of infinitely different sizes in a two-dimensional dimension. The uneven distribution of energy along the length of each "string" contributes to perpetual motion with infinitely different speeds and scales, as well as to the formation of the next stage of elementary particles in the form of triangles of infinitely different sizes, i.e. in three-dimensional dimension.

"Strings" with a set frequency and information for their further actions are suddenly released from the "super-perfect energy-informational field".

The relationship of the world and the whole organism is carried out through perspiration with the whole body surface whole body, i.e. the exchange of information between the environment and the integrity of the body at the supramolecular level is free. Therefore, according to the teachings of the great Russian scientist V. I. Vernadsky, man is in the biosphere.

In this regard, any elementary particle of the whole organism is connected with all elementary particles of the cosmos, i.e. information is exchanged.

We know that we communicate with the Universe through the vibration of words, emotions, and thoughts when we make choices and perform certain actions.

Events are the language of the Universe, so it is very important to perceive and understand the responses it sends us.

Vibrations that resemble it, scientists call "strings" of energy. This energy constantly passes through us and moves around us. We ourselves, as radio stations, constantly transmit energy signals about ourselves to the surrounding space. Whether we realize it or not, each of us participates in the continuous energy exchange of the Universe.

The individual energy field of a person, like a "passport" for the surrounding world, is:

- Physical energy (vibration of the body»;
- Emotional energy (vibration of the senses);
- Cognitive energy (thought vibration).

The interaction of mental energy and the surrounding world can be justified by the well-known quantum physics theorem of John bell, which consists in the fact that there are no isolated systems; each particle of the Universe is in "instantaneous" (exceeding the speed of light) connection with all other particles. The entire System, even if its parts are separated by huge distances, functions as a whole. Man is part of this System.

The main concepts of the " mechanism of action" of the physical factor on the whole organism are:

1. A single eternal "super-perfect energy-informational field" as the material substance of the universe creates the stability of interactions of all the contents of the entire Universe freely, submissively and humbly.
2. Man is part of the " energy information system" of the Universe. The relationship of the Universe with it is carried out through the perspiration system of the whole organism.
3. "Energy-informational dynamics" in the whole organism is carried out by means of quantum tunneling.
